

HET PATEL

AI & Data Science Student | Aspiring Data Scientist

Ahmedabad, Gujarat | Ph: 8733001848 | Email: hetpatel2118@gmail.com

GitHub: github.com/Dyna-Techo

CAREER OBJECTIVE

Final-year AI & Data Science student with practical experience building Python-based projects, including a risk-ranking tool for stocks and mutual funds and a text classification system for email intent. Published a research paper on AI-driven personalization in engineering education. Take an end-to-end approach to projects, from exploring raw data and building models to implementing practical solutions, with a focus on iterative problem-solving. Seeking a Data Science internship to apply this approach to real-world datasets and contribute to meaningful, data-driven solutions.

EDUCATION

B. Tech in Artificial Intelligence & Data Science | Apollo Institute of Engineering, Ahmedabad — Expected Graduation: 2027

TECHNICAL SKILLS

- Programming: Python, SQL
- Data Science & Analytics: Pandas, NumPy, Data Cleaning, EDA, Feature Engineering
- Machine Learning: Scikit-learn, K-Means Clustering, Feature Scaling
- Data Visualization: Matplotlib, Seaborn, Power BI
- Tools: Git/GitHub, Jupyter Notebook, Excel

PROJECTS

Customer Churn Prediction — Telecom Analytics with Explainability | Python, Scikit-learn, XGBoost, SHAP, Streamlit

Live demo = <https://vercel.com/dyna-techo/churniq-dashboard/Fo1Atyp7Wb8GuXEcywKV9cAaPob2>

- Tried Logistic Regression, Random Forest, and XGBoost on the Telco Churn dataset (7,043 customers) and went with Random Forest since it gave the best results (ROC-AUC 0.842, Recall 0.794).
- Used SHAP to figure out what actually drives churn (Contract Type, Tech Support, Tenure came out on top), then built a Streamlit dashboard so the results are easy to explore.

Investment Advisor — Risk-Based Stock & Mutual Fund Recommender | Python, Pandas, Scikit-learn (K-Means)

Live demo = <https://vercel.com/dyna-techo/investment-advisor/FtpyRFx7YEvBoJyXcKtWwNyDuSh8>

- Built a pipeline covering 441 stocks and 2,032 mutual funds — calculated CAGR, volatility, and Sharpe Ratio for each, then grouped them into risk tiers using K-Means clustering.
- Added a matching engine that suggests assets based on the user's risk tolerance, time horizon, and investment mode, wrapped in a simple web interface.

Email Intent Classification System | Python, Scikit-learn, TF-IDF, Logistic Regression

- Trained a Logistic Regression model on TF-IDF features from 328 labelled emails across 8 intent categories — got 63.5% test accuracy.
- Built a desktop app (custom Kinter) so predictions can be checked in real time, with a fallback for low-confidence cases.

CERTIFICATIONS

- Open Science 101 — NASA
- AI/ML for Geodata Analysis — ISRO (IIRS)
- Oracle Agentic AI Foundations Associate — Oracle
- AI Foundation Course — Jio Institute
- Data Science Course — Code with Harry (In Progress)

KEY STRENGTHS

- Analytical Problem-Solving
- End-to-End Project Development
- Continuous Learning Mindset
- Team Collaboration & Communication

AREAS OF INTEREST

- Data Science
- Data Analytics
- Machine Learning
- Data Visualization
- Python Programming
